Campaign Title: You Are the Gift of Life

Health Topic: Living and deceased kidney donation.

Goal: To improve the openness to organ donation whether it be deceased donation or through living donation.

Key Influencers of Behavior

The first key influencer for improving attitudes towards living and deceased kidney donation are the physicians that most regularly work on kidney transplantation such as nephrologists and transplant surgeons. The second key influencers would be the heads of regulatory bodies for kidney organ transplantation like the Health Resources and Services Administration (HRSA) and United Network for Organ Sharing (UNOS). While there are other potential key influencer candidates, such as insurance providers who are incentivized towards transplantation due to lower cost, the two mentioned have the strongest and most obvious podium to socially market successfully (Zhang et al., 2023).

The Three Audience Segments

Our first segment is aimed at healthy adults. Healthy adults are the citizens most immediately well equipped to provide a high quality organ to recipients. This is due to their likelihood for an exceptional organ and the certainty to provide an accurate medical history, making them a priority population for donation. The second segment is family and friends of those living with chronic kidney disease. These are similarly a priority population for encouraging engagement with living donation process given their personal connection to the recipient. The final segment, the general population, is a priority segment as becoming an organ donor, while not an immediate solution to the needs of those sick today, is an investment in a life that needs saving in the future.

Audience Segmentation #1: Healthy Adults

According to the Columbia University Irving Medical Center (2019), of the 285,000 patients on the kidney waitlist who receive at least one organ offer, nearly 30% die annually. Citizens like you have the power to play a role in preventing one of these deaths. Living donor donation ensures high quality organs are provided to those in need - and is one of the safest surgeries on the planet (National Kidney Foundation, 2024). Do you know a friend or loved one living with chronic kidney disease? A life on dialysis isn't the only path forward for them. Organ donation is one of the safest surgical procedures on

the planet, and is guaranteed to change your loved ones life. Learn more about donation at <https://www.organdonor.gov/Links to an external site.>

Audience Segmentation #3: General Public

Nearly 85,000 people die annually on the organ transplant waitlist waiting for a kidney. Not only can becoming an organ donor save one of those 85,000, but 7 others through various organ donations that becoming a donor entails (Middleton, 2024). Learn how you can save lives at with check of a box at <https://www.organdonor.gov/Links to an external site.>
