

Design 10: Monitor & Evaluation Plan

Selection of Health Topic

Living kidney donation is one of the most direct ways healthy people can save a life, with more than 90,000 people currently on the transplant waitlist in the United States (National Kidney Registry, 2026). Living donors provide higher quality organs on average, and the planned nature of the surgery makes it lower risk than deceased donation. All costs to the donor are fully covered (National Kidney Registry, 2026). Healthy adults in the United States aged 18 to 40 across all conceivable demographics. On average, this is someone who is values driven and responds to calls to action.

Purpose of Evaluation

The evaluation's aim is to assess whether the You Are the Gift of Life campaign is increasing the volume of screener completions among healthy adults ages 18 to 40, and if it is disabusing individuals of ill conceived notions of the risk of living kidney donation. Ultimately, stakeholders will be provided with the outcomes of the campaign to demonstrate the value and generate continued investment.

Measurements of Input, Output, Outcomes, and Impact

Inputs: The budget for the campaign, staff hours, social media posts, recorded contributions from partners, volunteer hours

Outputs: Social media impressions, QR code accesses, screener completions

Outcomes: Percentage of the audience that knows there are no out of pocket costs, percentage of the audience that knows that surgical risk is below 1%, total number of screener completions tied to campaign advertisements

Impact: The number of living donors connected to the campaign screener and a reduction in time of the transplant waitlist

Techniques of Input, Output, Outcomes, and Impact

Inputs: Budgets will be tracked through financial records, staff hours will be pulled through timekeeping software, contributions from partners will be reported directly from partnership documentation.

Outputs: Social media impressions are pullable directly from platforms, QR code scan are tracked natively through the URL, and completions will be tracked in the same repository as the URL scans.

Outcomes: Surveys will be administered to small batch of individuals screened for comparison to individuals who complete the screener and are surveyed post, volume of QR code scans, and screeners completed daily.

Impact: A partnership with the National Kidney Registry the looks at donation rates and screener completion and subsequently an increase in living donation.

Timing of Measurement

Inputs: Documentation beginning at campaign launch and tracked throughout the duration of the campaign period.

Outputs: QR code usage and screener completion will be monitored daily.

Outcomes: Baseline surveys are conducted from a small sample of individuals pre-screen, and post surveys will conducted with all individuals who complete the screener 3 months post.

Impact: 1 year post screener follow ups will be conducted with individuals to generate longitudinal insights into outcomes.

Return of Investment

Return on investment is primarily evaluated through screener completions and the cost associated with each completion. Dialysis is exceedingly expensive at nearly \$100,000 annually, so each living donation that occurs helps prevent a large cost burden on the healthcare system as non-emergent surgeries are less costly than their counterparts. To create concrete numbers, estimations of cost per living donor can be summed with the cost of living donation for comparison to dialysis and deceased donation.
