1. Health Topic: Kidney Living Donor Promotion

Living kidney donation is one of the most direct ways to save a life with more than 90,000 people in the United States being on the transplant waitlist (National Kidney Registry, 2026). While deceased donation is important, the complexities of organ procurement and matching make it riskier. Living donors provide higher quality organs that are likely to last longer, and surgeries are less risky given their planned nature. The campaign targets healthy adults given they are most likely to be medically eligible to donate while many have not considered it.

2. Theory or Model: Theory of Planned Behavior

The Theory of Planned Behavior (TPB) was chosen because kidney donation is a one time, deliberate, planned decision. The Transtheoretical model was considered, but is more well suited for a consistent, chronic behavior. Lee et al. (2019) states that a priority audience is more likely to adopt a behavior if they believe they will be successful in performing it and TPB three constructs tackle this perfectly.

Attitude: Raise awareness about the positive outcomes of living kidney donation. Show what recipients lives look like after transplantation and counters negative outcome beliefs about donor risk by providing info on the safety of living donation surgery.

Subjective Norms: Normalize living donation by sharing stories, high family and peer support for the decision to donate, show that donation is ordinary and isn't out of the norm.

Perceived Behavioral Control: Provide education on the ease of screening, explain the first steps, communicate the process is totally optional and can be stopped at any point.

3. Describe two constructs

For this specific campaign, the two constructs that will be utilized are attitude and perceived behavior control.

Attitudes: Most healthy adults have not considered living kidney donation, and when they do, their beliefs about the outcomes are likely skewed toward the negative - inclined to think about issues like surgical risks and costs. Shifting outcome beliefs to associate donation with giving someone their ordinary life will help motivate them to consider the behavior.

Perceived Behavioral Control: Provide education about the five minute introductory from the NKF and show how low commitment and in the donors control the process is.

4. Create (and embed) two subway posters:

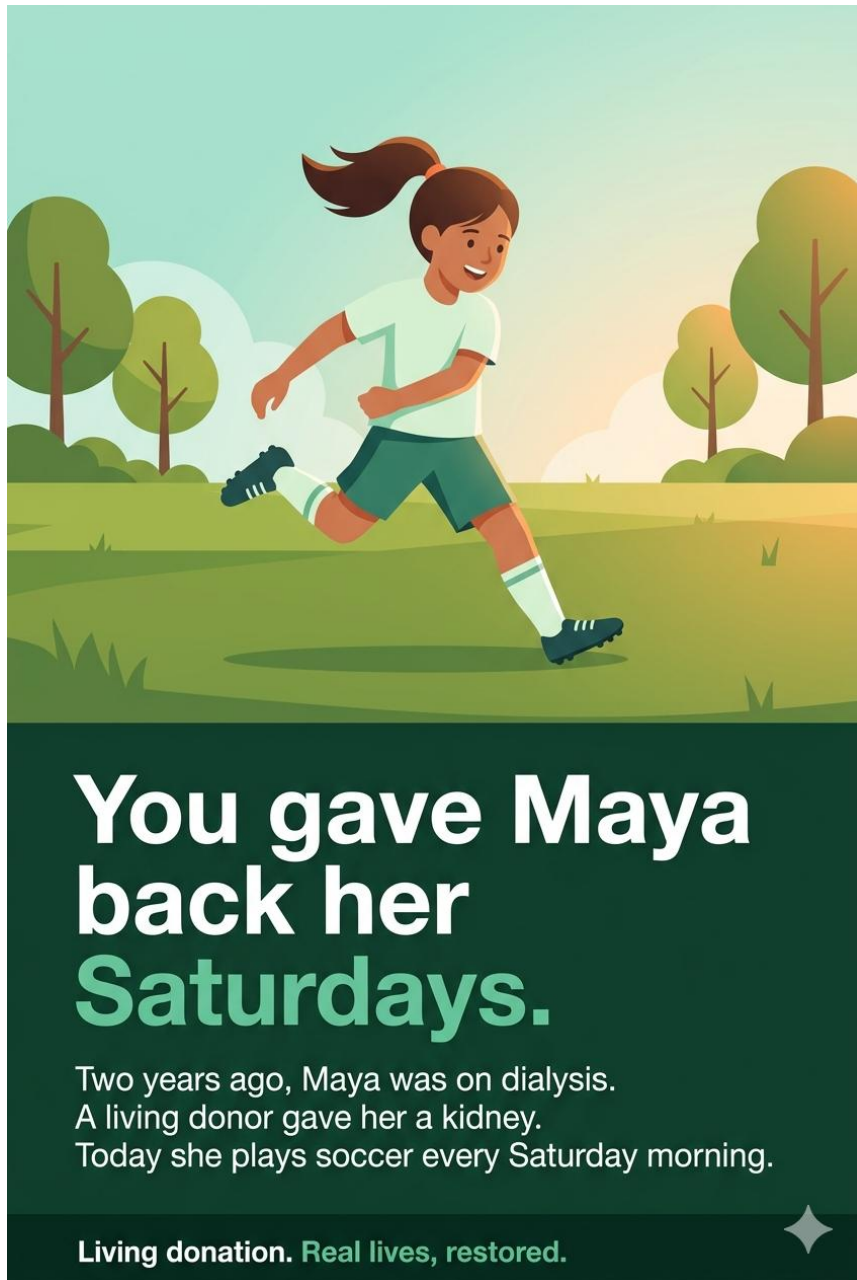

Image created using ChatGPT (DALL-E), OpenAI, 2026.

5 minutes is all it takes to find out if you can donate.

More people qualify than realize it.
The screening starts online — no commitment.

- 1 Answer 5 minutes of questions**
No commitment. Confidential.
- 2 A transplant team reviews your answers**
They contact you within a few days.
- 3 You decide what happens next**
You can stop at any point.
